Charli Myers

Data Science student | Software and data projects

Brisbane, Queensland | Australian citizen with Australian work rights

Available 20 hours per week | Portfolio | GitHub | Kaggle | Devpost

PROFILE

University of Queensland BSc Data Science student seeking part-time junior software, data or quality-focused opportunities. Personal projects span interactive scientific visualization, browser tooling and web applications. Uses AI-assisted development, with project scope and current limitations documented for review.

EDUCATION & TECHNICAL SKILLS

University of Queensland - Bachelor of Science, Data Science; currently studying.

Languages: Python, SQL, C++, JavaScript, TypeScript, Java.
Project technologies: React, Three.js, Vite, Express, Supabase, Git.
Data-project tools: pandas, NumPy, scikit-learn, Matplotlib; Kaggle notebooks.

SELECTED SOFTWARE PROJECTS

Bio Galaxy | Interactive scientific atlas

React, TypeScript, Three.js, Express | Public-source personal project

Browser-based 3D atlas with separate rendering, navigation and scientific data layers. Combines physical-scale exploration and a taxonomy view, with attribution for public scientific sources. Submitted to the 3D Websites Hackathon on Devpost.

Devpost submission and project links

Heliora Studio | Celestial visualization application

React, TypeScript, Vite, Three.js, Supabase | Private source

Personal application combining interactive celestial scenes and chart interfaces. Uses a React/Vite frontend, Three.js rendering and astronomy-engine, with Supabase integration and optional AI-provider services.

RiceLayer | CSS theming browser extension

TypeScript, React, Chrome Manifest V3, Express | Prototype

Extension and backend workspaces for CSS-only themes, presets, sanitization, page validation and rollback paths. Optional Gemini integration runs through the backend. Organized into extension, server and web workspaces.

Public source and setup instructions

ScopeKit | Browser-based planning demonstration

HTML, CSS, JavaScript | Live demonstration

Codex-assisted prototype turning short briefs into editable deliverables, acceptance checks and open questions. Supports Markdown export and JSON backup/restore. Uses deterministic keyword rules rather than a model API.

Live ScopeKit demonstration

Data work, hackathons and further project context

DATA PROJECTS

Titanic ML | Kaggle learning project

Python, pandas, NumPy, scikit-learn, Matplotlib | Work in progress

Notebook contains exploratory analysis, title/family/cabin feature engineering, a majority-class baseline, classifier comparisons, stratified cross-validation, random-forest tuning and prediction-export code. Currently resolving data-loading issues before completing evaluation. Notebook is private.

Kaggle profile: charl1

CASMI 2026 | Spectral-library retrieval baseline

Python, NumPy, pandas, PyArrow; optional RDKit and Numba | Local research prototype

Local source implements mass-filtered candidate retrieval for molecular identification from mass spectra. Includes configurable precursor/fragment tolerances and validation settings. Research implementation in progress; competition evaluation remains pending.

FURTHER SOFTWARE WORK

Autoretto | Media release operations

React, TypeScript, Express, Supabase | Development project

Personal full-stack application with a studio UI, server-side YouTube OAuth, media pipeline orchestration and release-state handling. Combines media processing and publishing workflows with configurable external providers. Ongoing development work includes test remediation and deployment verification.

Additional experiments: Math Atlas (mathematical visualization); Soma (schematic anatomy and molecular exploration); Alchemia (chemistry learning game); Substrate (Devvit/Phaser community prototype); VELLAVI and Soft Circuit (commerce implementations). Detailed scope and repository mapping appear in the portfolio project directory.

HACKATHON RECORD

Confirmed submission: Bio Galaxy, 3D Websites Hackathon, 2026.
Draft work: ScopeKit for LaunchPad Hacks; Autoretto on Devpost. Additional draft participation: Build with Gemini XPRIZE and Reddit Games with a Hook.

PROJECT CONTEXT

Personal/student projects developed with AI assistance, including OpenAI Codex. The portfolio provides technical scope, source links where public, and current project status. Interested in contributing to implementation, testing and documentation with guidance from experienced engineers.

Portfolio and status reviewed 9 November 2026. Public source links are provided where available; private repositories retain their existing visibility.
